WHAT IS THE RISKS OF THE WEB

There is no more respect for people, now show people and ordinary people are very affected by these risks of the web. through messages, videos, online photos and much more the victim is oppressed. Online risks represent all those dangerous situations deriving from an unaware and responsible use of digital technologies by children and teenagers.

Therefore :

- Cyberbullying,
- Cyber Predators
- Phishing
- Posting Private Information

CYBERBULLING

WHAT IS

Cyberbullying is a more dangerous form of bullying. in fact, it is not limited only to a specific social situation but also extends and continues on social networks which are the way of communication for young people. It can happen through messages, photos, videos posted online, social networks and online games.

PREVENATION

one way to prevent cyberbullying is to make sure you decrease your exposure time to new technologies. Passing the time and fiddling on the Internet are acceptable moments if used in the proper manner and timing. In addition, the kids, online, can also give vent to their creative abilities in interesting and useful activities for their growth. another way is through educational institutions. in fact, in recent years, each school has planned training projects for pupils for a conscious use of technology and for the prevention of cyberbullying. yet another way is to regulate the use of the web in the family through software that does not allow access to risky sites or containing material not suitable for children.

CYBER PREDATORS

WHAT IS

sexual predators and others often persecute children on the Internet, taking advantage of their innocence, lack of adult supervision and abusing their trust. There they can exploit not only the innocence of children, but also their gift of imagination. Some things that might seem like everyday life to children, sexual predators can use to deceive them

PREVENATION

in recent years there has been an increase in the incorrect use of the possibilities offered by the network. Among these behaviors we also find grooming, that is, the online grooming of minors for sexual purposes by cyber predators. To prevent these grooming activities from occurring, causing real sexual offenses, action must be taken immediately. With the increase in the possibilities of access to the Internet for minors, it is necessary that greater educational attention is also associated with the use of the same. Increased awareness of the risks and what can be encountered on the web effectively reduces the possibility of online grooming.

PHISHING

WHAT IS

Is what cyber security professionals call the use of emails that try to trick people into clicking on malicious links or attachments. These can be especially difficult for kids.

Phishing emails and smishing texts can pop up at any time, but the cyber criminals who devise them keep watch on sites that are popular with children, and gather information such as email addresses and friends' names and other information to tailor their attacks, just as they do when spear phishing adults to access corporate networks. avoid clicking on emails or texts from strangers and to be wary of messages that appear to be from their friends but seem "off" or have no genuine personal message attached.

PREVENTION

A phishing attack occurs when someone tries to trick you into sharing personal information online, and to prevent this from happening, you need to be careful whenever you receive a message asking for personal information from a site. If you receive this type of message, you should never provide the requested information without verifying that the site is legitimate. For example, Google never sends unsolicited messages inviting the user to provide their password or other personal information.

POSTING PRIVATE INFORMATION

WHAT IS

Children do not yet understand social boundaries. They may post personally identifiable information (PII) online, for example in their social media profiles, that should not be out in public. This might be anything from images of awkward personal moments to their home addresses or family vacation plans.

PREVENTATION

A simple and efficient management of security measures concerning sensitive data is essential for the implementation of the acquisition to the production of information, including systems for disclosure to arrive at archiving until their destruction. The preventive measures are both at an organizational and at a technical level, it is therefore important not to disclose and network your sensitive data, such as your identity card and other private / personal data.
